UV Fail to Safe Alarm System

Developed by the Springhill Team with input from a major UK manufacturer, the UV TAG (Text Alert Generator) is an upgrade that meets the requirement for UV disinfection to be equipped with an alarm. Available in a variety of configurations, the alarm system informs the householder (or a nominated person) should the UV stop working.

The UV TAG can be used to upgrade existing equipment or it can be supplied as a complete UV disinfection system. The image above shows a UV with Alarm, Solenoid Shut Off Valve and Text Messaging facility.
